

TradeAlerts Pro Playbook

System Overview

- **Core:** Flask web app with real-time S&P500/NASDAQ stock scanner, live dashboard, automated simulation, and full-featured backtest lab.
- **Logic:** All signals/parameters are controlled via UI—no code edits needed.
- **Risk:** Industry-standard risk management baked in (1% risk/trade, \$10,000 starting balance, compound growth).
- **Expandability:** Backtest and run logic on any ticker list (SP500, NASDAQ, movers, crypto, etc.).

Workflow: From Backtest to Production

1. **Backtest Lab**

- Set any parameters (profit, stop, hold, triggers, % risk, etc.).
- Run against 1 year+ of historical data for all tickers.
- See every trade, stats, and visual equity curve.
- Download CSV logs, study winners/losers.

2. **Promote to Live**

- Click “Promote to Live”—your chosen config is instantly used in the live scanner and simulation.
- No code or restart required.

3. **Automated Simulation**

- Real-time, risk-controlled sim trading: buys/sells as signals fire.
- Portfolio dashboard: see all open trades, trade log, P/L, stats.
- Reset to \$10k and start fresh at any time.

4. **Live Alerts Dashboard**

- Only get “A+” signals (Prime) for ultra-high-conviction setups.
- See real triggers, sparkline, stats, and act fast.
- No more noise—just high-quality signals.

Best Practices

- **Trade only top signals:** Quality over quantity = real growth.
- **Stick to risk management:** 1% risk/trade, cut losers, let winners run.
- **Use S&P/NASDAQ for most of your capital;** add “top movers” or “news play” lists for alpha.
- **Backtest every tweak before going live:** The system makes this easy!
- **Journal and review:** Use export logs and simulation stats to improve every month.

Pro Features

- **Tweakable strategy controls:** No code needed—test, iterate, deploy from your browser.
- **Visual P/L and equity curves:** Always know how you’re doing.
- **Backtest any list, any market:** Crypto, pennies, blue chips—you choose.
- **Pro-level navigation and workflow:** Everything at your fingertips.

How to Expand

- Add new watchlists (NASDAQ100, crypto, etc.)—just drop in a symbol file.
- Scan “top movers”/news each day (add logic or plug in to Finviz, Yahoo, etc.).
- Build “alerts to phone/email/Discord” if you want.
- Test multi-strategy portfolios with ease.

Your Edge

****You're now running a setup that gives you full control, full transparency, and real statistical edge.**

No guessing—just facts, logic, and growth.**

****Ready to keep pushing the edge? Want this as a downloadable PDF/markdown? Just say the word!**

Let's make this the best trading system you've ever seen.**

Full Scanner Simulation

Our full scanner simulation engine iterates through the entire symbol universe, applies all enabled indicator filters (SMA, RSI, MACD histogram, Bollinger Bands breakout, VWAP threshold, etc.), and simulates trades in real-time or historical replay mode. It logs buy/sell events, reasons for decisions, and portfolio performance over time.

Full Scanner Backtesting

The backtesting module replays historical 1-minute and 1-day bar data across the full symbol set, applying the same indicator logic and trade execution rules. It calculates detailed metrics including win rate, average return, maximum drawdown, and Sharpe ratio—enabling side-by-side comparison of strategy variations.

Complex Indicator Logic

We support a full suite of technical indicators:

- ****Simple Moving Average (SMA):**** Configurable lookback and cross-over triggers.
- ****Relative Strength Index (RSI):**** Overbought/oversold thresholds and slope detection.
- ****MACD Histogram:**** Fast/slow EMA spans and signal line for momentum.
- ****Bollinger Bands:**** Customizable length and standard-deviation multipliers for breakout detection.
- ****Volume Weighted Average Price (VWAP):**** Intraday benchmark with threshold offsets.
- ****Custom Combinations:**** Flexible toggles for mixing any subset of the above filters in any order.
